Analyte	Value
IGF 1, LC/MS	163 Reference Range: 53-331 ng/mL
Z SCORE (FEMALE)	0.1 Reference Range: -2.0 - +2.0 SD See Note 1

TSI (THYROID STIMULATING IMMUNOGLOBULIN)

Analyte	Value
TSI	<89 Reference Range: <140 % baseline
Thyroid stimulating immunoglobulins (TSI) can engage the TSH receptors resulting in hyperthyroidism in Graves' disease patients. TSI levels can be useful in monitoring the clinical outcome of Graves' disease as well as assessing the potential for hyperthyroidism from maternal-fetal transfer. TSI results greater than or equal to ($\geq$) 140% of the Reference Control are considered positive.	

NOTE: A serum TSH level greater than 350 micro-International Units/mL can interfere with the TSI bioassay and potentially give false positive results.

Patients who are pregnant and are suspected of having hyperthyroidism should have both TSI and human Chorionic Gonadotropin (hCG) tests measured. A serum hCG level greater than 40,625 mIU/mL can interfere with the TSI bioassay and may give false negative results. In these patients it is recommended that a second TSI be obtained when the hCG concentration falls below 40,625 mIU/mL (usually after approximately 20-weeks gestation).

The analytical performance characteristics of this assay have been determined by Quest Diagnostics Nichols Institute San Juan Capistrano. The modifications have not been cleared or approved by the FDA. This assay has been validated pursuant to the CLIA regulations and is used for clinical purposes.

ESTRADIOL

70 pg/mL

Reference Range	
Follicular Phase:	19-144
Mid-Cycle:	64-357
Luteal Phase:	56-214
Postmenopausal:	< or = 31

Reference range established on post-pubertal patient population. No pre-pubertal reference range established using this assay. For any patients for whom low Estradiol levels are anticipated (e.g. males, pre-pubertal children and hypogonadal/post-menopausal females), the Quest Diagnostics Nichols Institute Estradiol, Ultrasensitive, LCMSMS assay is recommended (order code 30289).

Please note: patients being treated with the drug fulvestrant (Faslodex(R)) have demonstrated significant interference in immunoassay methods for estradiol measurement. The cross reactivity could lead to falsely elevated estradiol test results leading to an inappropriate clinical assessment of estrogen status. Quest Diagnostics order code 30289-Estradiol, Ultrasensitive LC/MS/MS demonstrates negligible cross reactivity with fulvestrant.
