

Modified CTSIB (Main Results)

Name: Jennifer Pei Ru Hao

ID#: JEP1994

Facility: San Jose

The modified Clinical Test of Sensory Integration and Balance (mCTSIB) is designed to determine impairments in balance-related sensory information utilization. The results are based on Center of Pressure (COP) Path Length from four, 20-second trials with different sensory conditions (eyes open/closed, standing on firm/foam surface). Performance on the various trials are assigned a percentile ranking that describes how well proprioception, vision and vestibular information are used for balance compared to adults of the same sex.

Modified CTSIB (COP Details)

Name: Jennifer Pei Ru Hao
ID#: JEP1994
Facility: San Jose

Visualizations of COP Path Length and 95% Ellipse Area for the Baseline and most recent Post-Baseline trials are shown below. The center of each image, where the dotted lines intersect, represents the average COP position. In the tables, additional COP metrics are provided.

Baseline Results

DATE	STD (ML,AP,ANG)	PRO (ML,AP,ANG)	VIS (ML,AP,ANG)	VEST (ML,AP,ANG)
3/11/2026 4:51:43 PM	1.5, 1.5, 49	2.6, 2.4, 6	1.3, 2.2, 12	1.5, 2.7, -5

Post-Baseline Results

Cervical Challenge (Main Results)

Name: Jennifer Pei Ru Hao
ID#: JEP1994
Facility: San Jose

This test is designed to determine balance abnormalities based on Center of Pressure (COP) Path Length, which occur when the head is moved into different anatomical positions. There are ten positions tested, which are compared to a reference position where the person stands with head neutral. Interpretation of this test requires advanced knowledge of the head, neck and spine.
